

Riduttori epicicloidali  
Planetary Gearboxes

Le gamme di riduttori planetari "RE" e "GB", sono state concepite per soddisfare le aspettative del mercato moderno, sempre più esigente e selettivo. Oggi vengono introdotte nuove taglie che nella continua ricerca di dinamicità, evoluzione tecnologica e flessibilità, completano e in parte rinnovano l'offerta Dinamic Oil sul mercato delle trasmissioni di potenza.

Questi riduttori sono stati studiati per le applicazioni più selettive, tenendo conto sia dei forti sovraccarichi delle applicazioni mobili sia delle esigenze di lunga durata ed affidabilità degli impieghi industriali.

I prodotti Dinamic Oil trovano infatti applicazione con successo su macchine mobili nei settori sollevamento e trasporto, edile, cantieristico, agricolo e marino, così come nelle rotazioni di pompe per calcestruzzo, escavatori, autogrù, gru per autocarro e piattaforme aeree. I riduttori planetari sono largamente utilizzati negli impianti industriali nei settori più svariati: lavorazione lamiera, siderurgico, lavorazione materie plastiche, depurazione acque, chimico, energetico, minerario e di trasformazione in genere.

Questo nuovo catalogo 2012 rappresenta le prestazioni dei riduttori in base alla potenza trasmissibile rispetto ad un fattore di servizio unitario, consentendo una selezione semplice e veloce in funzione dei fattori di servizio richiesti.

I tecnici Dinamic Oil, che si avvalgono dei programmi di calcolo più aggiornati, sono a disposizione dei clienti per una selezione più approfondita, in funzione di normative fem, di durate di vita teorica o di altri metodi di calcolo.

Il catalogo illustra i riduttori attualmente in produzione con coppie massime ammissibili comprese tra 1000 Nm e 3000000 Nm.

Oltre alle diverse versioni di supporti di uscita e predisposizioni per attacco motore, è stata arricchita la gamma degli accessori in ingresso e in uscita che rendono estremamente versatile l'applicazione dei riduttori Dinamic Oil.

## 2.0 Forme costruttive disponibili

### MOTORI UTILIZZABILI

- 1 Motore elettrico
- 2 Motore idraulico orbitale
- 3 Motore idraulico a pistoncini assiali
- 4 Motore idraulico a pistoncini radiali
- 5 Motore idraulico orbitale "MLR"

### TIPI DI ENTRATE

- 9 Predisposizione attacco motore
- 10 Albero veloce
- 11 Motore elettrico diretto
- 12 Motore orbitale diretto
- 13 Freno negativo "F1../F2.."
- 14 Freno negativo "F5../F6../F8../F9"
- 15 Flangia standard
- 16 Flangia attacco "MZ"
- 17 Flangia attacco "MD"

### STADI DI RIDUZIONE

- 18 Riduttore angolare entrata diretta
- 19 Uno stadio di riduzione
- 20 Due stadi di riduzione
- 21 Tre stadi di riduzione
- 22 Quattro stadi di riduzione
- 23 Cinque stadi di riduzione

### SUPPORTI E ALBERI DI USCITA

- 24 Supporto uscita "N"
- 25 Supporto uscita "P"
- 26 Supporto uscita "T"
- 27 Supporto uscita "TR"
- 28 Supporto uscita "TL"
- 29 Supporto uscita "H"
- 30 Supporto uscita "F"
- 31 Supporto uscita "NQ"
- 32 Albero uscita cilindrico
- 33 Albero uscita scanalato
- 34 Albero uscita femmina scanalato
- 35 Albero uscita esagonale
- 36 Albero uscita femmina cilindrico

### ACCESSORI

- 37 Pignone "P"
- 38 Flangia "FL"
- 39 Boccia scanalata "BS"
- 40 Manicotto esagonale "ES"
- 41 Barra scanalata "BF"
- 42 Giunto di attrito "GA"
- 43 Fondello di arresto "EP"
- 44 Vaso di espansione "VE"

### 3.0 Definizioni tecniche

Tutti i valori prestazionali indicati nel presente catalogo sono calcolati secondo le normative ISO 6336 e ISO 281, ma potrebbero non rispondere a ulteriori requisiti richiesti dai regolamenti interni degli Enti certificatori. Per selezioni in accordo con tali regolamenti contattare il servizio commerciale Dinamic Oil.

#### $f_s$ - Fattore di servizio

è il fattore che tiene conto della gravosità dell'applicazione; dipende dalle condizioni di funzionamento, dal tipo di azionamento e dalla frequenza degli avviamenti.

I dati forniti nel presente catalogo sono calcolati per  $f_s = 1$ .

Il valore del fattore di servizio di un riduttore è calcolabile dividendo la sua potenza nominale per la potenza assorbita.

#### Fattori di servizio (tab. 1)

	CONDIZIONI DI FUNZIONAMENTO								
	Uniforme			Variabile con urti moderati			Variabile con urti forti		
	U			M			H		
ore / giorno	AVVIAMENTI / ORA								
	< 16	16 - 63	64 - 250	< 16	16 - 63	64 - 250	< 16	16 - 63	64 - 250
< 0.5	0.9	1.3	1.5	0.9	1.3	1.5	1.2	1.5	1.8
0.5 - 3	0.9	1.3	1.5	1.2	1.5	1.8	1.7	2.0	2.3
3 - 8	1.2	1.5	1.8	1.4	1.8	2.0	1.9	2.3	2.8
8 - 24	1.4	1.8	2.0	1.7	2.0	2.5	2.4	2.8	3.0

#### $P_1$ - Potenza nominale [kW]

è la potenza meccanica trasmissibile dal riduttore, riferita all'ingresso, alla quale con  $f_s = 1$  il riduttore ha una durata di vita teorica pari a 10.000 ore secondo la norma ISO 6336. Tale valore non tiene conto di eventuali limiti di capacità termica del riduttore, ma si basa esclusivamente sulla tenuta meccanica in funzione della velocità di utilizzo.

#### $P_a$ - Potenza assorbita [kW]

rispetto alla potenza installata o disponibile, è il valore di potenza realmente assorbita dall'applicazione, riferita all'ingresso del riduttore.

#### $P_t$ - Potenza termica [kW]

è la massima potenza meccanica che il riduttore può trasmettere in funzionamento continuo, con lubrificazione a sbattimento, senza oltrepassare il livello termico limite (temperatura dell'olio non superiore a 90°C).

Potenze superiori possono essere trasmesse utilizzando tenute in viton e oli sintetici o appositi dispositivi di raffreddamento. I valori indicati per le varie grandezze di riduttore si riferiscono ad un funzionamento continuo con velocità in ingresso di 1500 RPM, temperatura ambiente di 20°C, altitudine 0 / 500 m, applicazione al coperto.

Per diverse condizioni di impiego il valore di potenza termica deve essere moltiplicato per i fattori termici indicati nella seguente tabella. Per periodi di funzionamento limitati, seguiti da periodi di riposo sufficientemente lunghi da garantire un opportuno raffreddamento del riduttore, la potenza termica perde il suo significato e può essere trascurata.

## Fattori termici (tab. 2)

Temperatura ambiente	Tempo di funzionamento [%]				
	100%	80%	60%	40%	20%
10°	1.2	1.3	1.4	1.6	1.8
20°	1.0	1.1	1.3	1.4	1.6
30°	0.8	1.0	1.1	1.3	1.4
40°	0.7	0.8	1.0	1.1	1.3
50°	0.5	0.7	0.8	1.0	1.1

Altitudine [m]	Velocità in ingresso [RPM]				
	400	800	1000	1500	2000
0	1.2	1.1	1.1	1.0	0.7
500	1.2	1.1	1.1	1.0	0.7
1000	1.1	1.0	1.0	0.9	0.6
1500	1.1	1.0	1.0	0.9	0.6
2000	1.1	1.0	1.0	0.9	0.6

## $P_d$ - Potenza da dissipare [kW]

rappresenta la potenza che un eventuale sistema di raffreddamento deve dissipare, nel caso in cui la potenza da trasmettere sia superiore alla potenza termica del riduttore.

## $\eta_m$ - Rendimento meccanico

è il rapporto tra potenza meccanica in uscita e potenza meccanica in ingresso; normalmente è considerato pari a 0.97 – 0.98 per ogni stadio di riduzione epicicloidale di cui è composto il riduttore e pari a 0.94 - 0.95 per l'eventuale coppia conica; il valore effettivo dipende da diversi fattori tra quali velocità, coppia, rapporto, posizione di montaggio e lubrificazione.

## $T_2$ - Coppia trasmessa [Nm]

è il valore di coppia applicata in continuo alla velocità  $n_1$ , alla quale il riduttore ha una durata di vita teorica di 10000 h per gli ingranaggi e 5000 h ( $L_{h10}$ ) per i cuscinetti dell'ingranaggeria.

## $T_{max}$ - Coppia massima trasmissibile [Nm]

è la coppia massima trasmissibile dall'accessorio eventualmente fornito a corredo del riduttore. Questo valore potrebbe limitare la coppia massima trasmissibile dal riduttore.

## $T_{2max}$ - Coppia massima [Nm]

è la coppia massima d'uscita ammissibile come punta o per brevi durate (calcolata al 90%  $R_s$  del componente più debole). Per azionamenti che comportano un elevato numero di avviamenti o inversioni occorre considerare valori di coppia massima opportunamente ridotti.

Il valore indicato si riferisce alla versione con albero femmina scanalato (FS); versioni diverse potrebbero avere valori inferiori.

## $T_b$ - Coppia frenante [Nm]

è il valore della coppia frenante trasmissibile staticamente dal freno negativo.

### **$n_1$ - Velocità in ingresso [RPM]**

è la velocità al lato veloce del riduttore.

### **$n_2$ - Velocità in uscita [RPM]**

è la velocità al lato lento del riduttore.

### **$n_{1max}$ - Velocità massima [RPM]**

è la velocità massima in ingresso al freno. Per applicazioni con valori superiori rivolgersi al servizio commerciale Dinamic Oil per verificare la compatibilità con l'applicazione.

### **$i_e$ - Rapporto di riduzione effettivo**

è il rapporto di riduzione effettivo, cioè il rapporto tra la velocità di ingresso e quella di uscita dal riduttore.

### **$n_{xh}$ - Indice di durata [RPMxh]**

è il valore che equivale al prodotto tra la velocità e la durata di vita teorica espressa in ore. È espresso come  $n_2xh$  quando riferito alla velocità in uscita, come  $n_1xh$  quando riferito alla velocità in ingresso.

#### **Valori indicativi delle durate richieste per diverse applicazioni (tab. 3)**

<b>Applicazione</b>	<b>Ore di vita richieste</b>
Macchine agricole	300 - 3000
Macchine con funzionamento intermittente o per brevi periodi (macchine per l'edilizia)	3000 - 8000
Macchine con funzionamento intermittente o per brevi periodi con alta affidabilità operativa (montacarichi)	8000 - 12000
Macchine con funzionamento per 8 ore al giorno, ma non pienamente utilizzate (macchine varie per l'industria, frantoi rotativi)	10000 - 25000
Macchine con funzionamento per 8 ore al giorno pienamente utilizzate (macchine varie per l'industria, nastri trasportatori)	20000 - 30000
Macchine con funzionamento continuo (laminatoi, macchine tessili)	40000 - 50000

### **$k_f$ - Fattore di correzione**

è il fattore da applicare per calcolare la durata teorica dei supporti con alberi maschio per valori di  $n_{xh}$  diversi da quelli dei diagrammi riportati nel catalogo. Per tutti i riduttori le curve dei carichi esterni sono calcolate per:

- $n_2xh = 100.000$  per i supporti in uscita
- $n_1xh = 1.500.000$  per i supporti in ingresso

### **$L_{min}$ - Lunghezza minima del braccio di reazione [mm]**

è la lunghezza minima consigliata per il braccio di reazione da realizzarsi nelle applicazioni di tipo pendolare.

## 4.0 Selezione del riduttore

### 4.1 Selezione

La selezione del riduttore avviene sulla base del fattore di servizio richiesto dall'applicazione e della velocità richiesta in uscita. Una volta determinato il motore elettrico (nei termini di potenza e velocità nominale), occorre selezionare quel riduttore che abbia il rapporto di riduzione necessario per raggiungere il valore di velocità richiesto in uscita ed una potenza nominale tale che il rapporto tra il suo valore ed il valore della potenza nominale del motore è superiore al fattore di servizio.

$$i_e = n_1 / n_2$$

$$P_1 \geq P_a \times f_s$$

Tale selezione deve essere poi verificata in funzione di altri parametri, come potenza termica, coppia impulsiva ed eventuali carichi radiali o assiali agenti sugli alberi maschi di ingresso e di uscita.

In caso di azionamenti non elettrici applicare lo stesso metodo facendo riferimento alla coppia in uscita richiesta dall'applicazione anziché alla potenza nominale.

### 4.2 Verifiche

#### Supporti di uscita e di ingresso del riduttore:

devono essere verificati in base agli eventuali carichi radiali e assiali presenti. Per ogni modello vengono riportati nel catalogo i diagrammi che rappresentano i carichi radiali dinamici sopportabili secondo la normativa ISO 281 per una durata L10 corrispondente a  $n_x h = 100.000$ . Per durate differenti è possibile ottenere i carichi radiali applicabili moltiplicando i valori dei diagrammi per il fattore correttivo  $k_f$ . In ogni caso il carico radiale non deve mai essere superiore al valore massimo raggiunto dalla curva del diagramma.

Per quanto riguarda gli eventuali carichi assiali, occorre verificare che non superino il valore massimo ammesso.

#### Coppia in uscita:

non deve comunque mai superare la coppia massima trasmissibile del riduttore selezionato. Occorre verificare con particolare cura che questo valore sia superiore a quello della massima coppia erogabile dal motore installato riportata all'uscita del riduttore (cioè moltiplicata per il rapporto di riduzione effettivo e per il rendimento meccanico del riduttore)

#### Velocità in ingresso:

Per valori di velocità diverse da quelle in tabella, contattare l'ufficio commerciale.

#### Potenza termica:

nel caso in cui la potenza installata sia superiore alla potenza termica del riduttore, occorre selezionare un riduttore di grandezza superiore, utilizzare olio sintetico unitamente con l'impiego di tenute in viton oppure prevedere un circuito di raffreddamento.

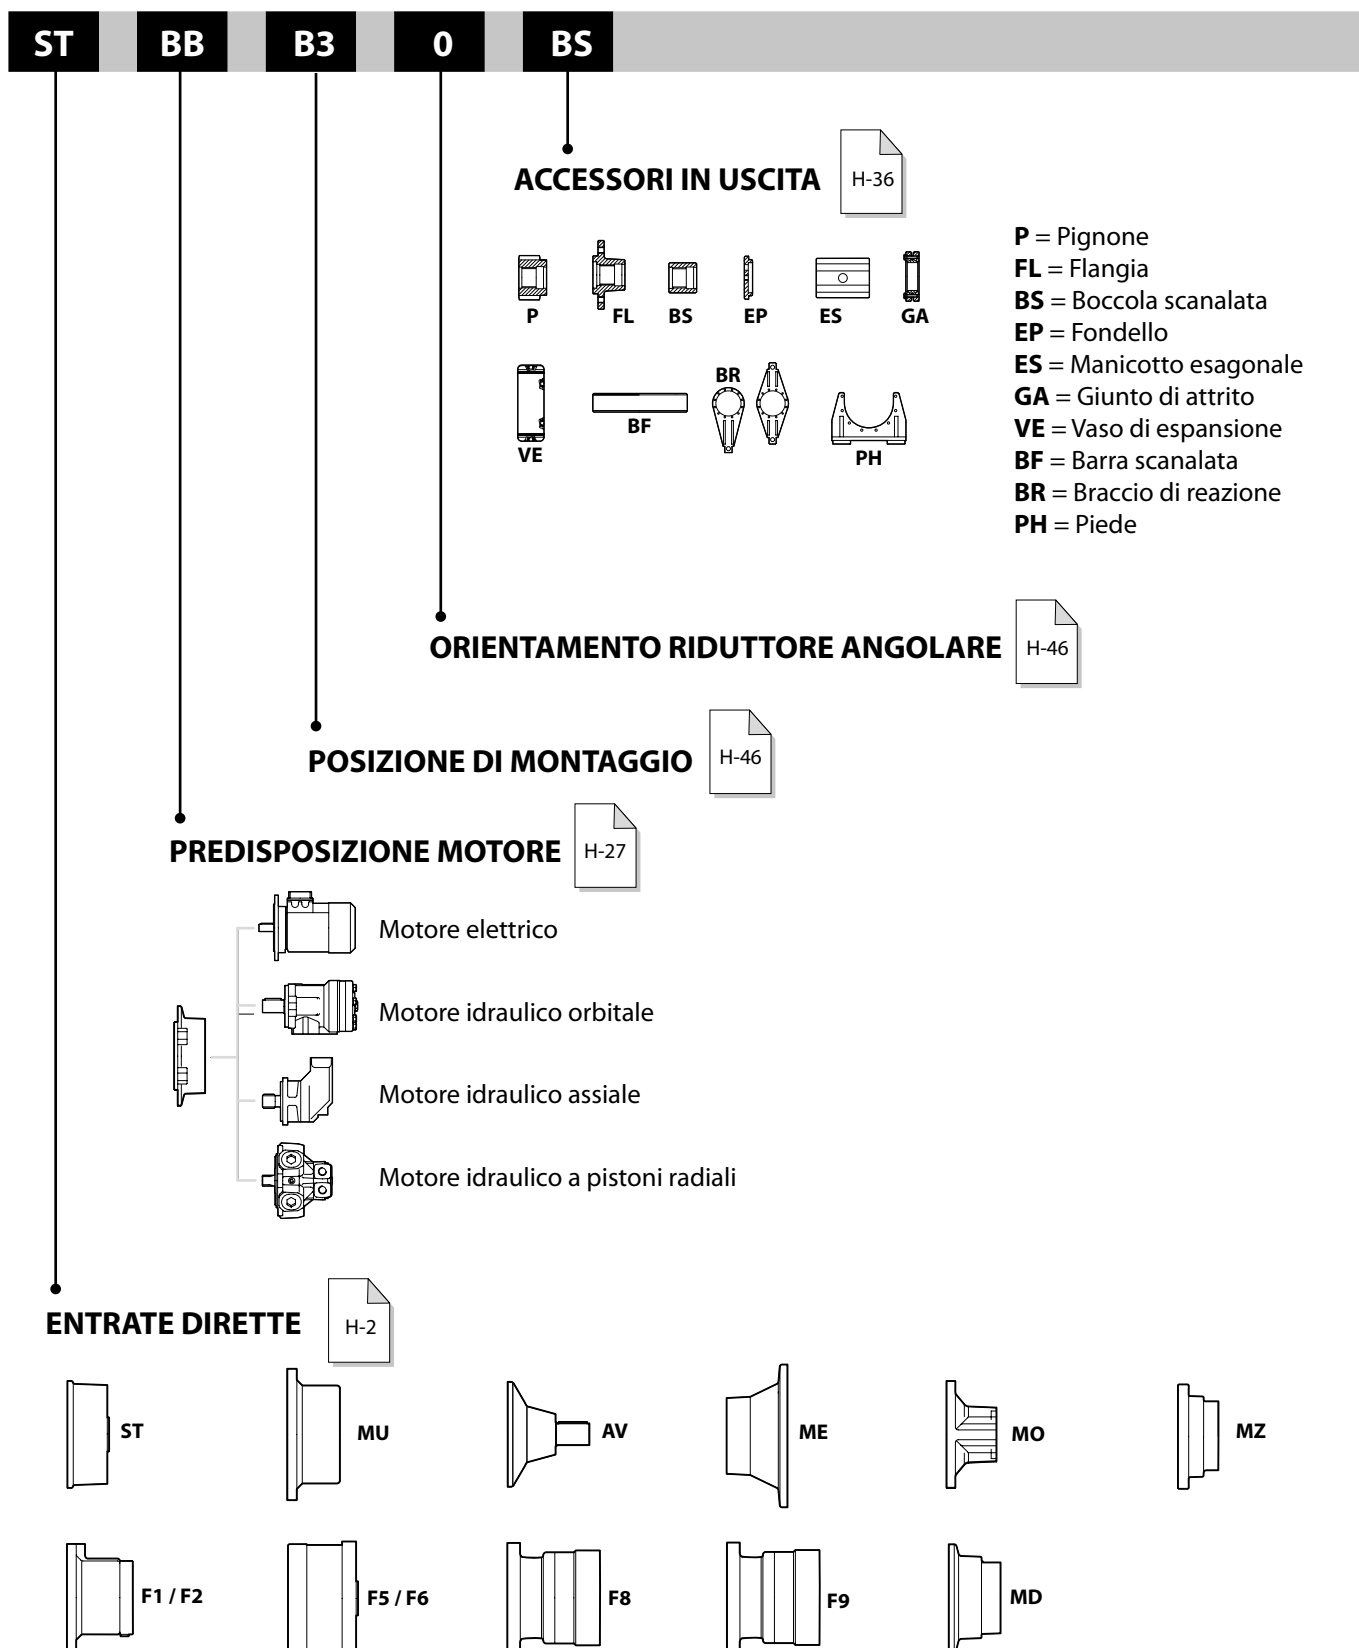

Nel caso dell'impiego di tenute in viton ed olio sintetico, si può considerare il fattore termico equivalente ad una temperatura ambiente inferiore di 20°C rispetto a quella reale, simulando in questo modo il fatto che il riduttore può accettare un surriscaldamento di 20°C rispetto ai dati di progetto.

Nel caso di utilizzo di un sistema di raffreddamento, la potenza da dissipare è

$$P_d = (P_a - P_t) \cdot (1 - \eta_m)$$

## 6.0 Freni idraulici negativi

### 6.1 Freni idraulici negativi a dischi multipli

I riduttori Dinamic Oil possono essere dotati di freno negativo statico a dischi multipli a comando idraulico.

I freni dal modello **F1** al modello **F2** sono previsti per il montaggio diretto di motori idraulici orbitali con flangiatura secondo norme SAE A.

I freni dal modello **F5** al modello **F6**, raggiungono coppie frenanti maggiori e sono predisposti con entrata integrale ST per il montaggio di flange e giunti di collegamento per una vasta gamma di motori in commercio.

I freni del modello **F8**, raggiungono coppie frenanti fino a 3.000 Nm ed sono predisposti con entrata integrale MU per il montaggio di flange e giunti di collegamento per una vasta gamma di motori in commercio.

I freni del modello **F9** raggiungono coppie frenanti fino a 1.500 Nm e possono avere la possibilità di montare un meccanismo a ruota libera fino alla coppia di 1.200 Nm. Sono predisposti con entrata "SAE C", "SAE D" ed entrata integrale ST. Tramite quest'ultima possono montare flange e giunti di collegamento per una vasta gamma di motori in commercio.

Il freno **MD** è montato all'interno di una flangia di collegamento diretto per motori MLR su stadi di riduzione RE110-240.

La frenatura è generata da molle che comprimono coppie di dischi fissi in acciaio temprato alternati a dischi mobili in bronzo; questa spinta si trasforma per attrito in coppia frenante.

L'apertura si ottiene introducendo nel freno olio idraulico in pressione; la pressione agisce su un pistone che comprime le molle permettendo ai dischi di ruotare liberamente. Si tratta di freni di stazionamento che agiscono creando una coppia frenante statica quando la pressione idraulica di comando è nulla. La loro azione cessa quando la pressione idraulica raggiunge il minimo valore per lo sbloccaggio.

Per i freni che hanno una camera di lubrificazione (F1, F2 e versioni standard di F5, F6 e F8) è necessario effettuare il riempimento (circa 0.1 l) con olio minerale di viscosità ISO VG 32.

Alcuni modelli di freni F5, F6, F8 ed F9 sono disponibili in versioni speciali che consentono valori elevati di velocità massima.

### 6.2 Selezione del freno

Occorre tenere in considerazione i seguenti parametri:

- Le coppie frenanti sono calcolate con pressione di comando nulla; nel caso di contropressioni nel circuito idraulico i valori effettivi di frenatura vanno ridotti come segue:

Coppia effettiva = Coppia teorica x (Pressione di apertura – Contropressione) / Pressione di inizio apertura.

- La coppia del freno moltiplicata per il rapporto di riduzione e divisa per il rendimento del riduttore, deve essere maggiore o uguale alla coppia richiesta in uscita:

$$T_b \times i_e / \eta_m \geq T_2$$

- Ad eccezione di particolari casi, la coppia del freno moltiplicata per il rapporto di riduzione e divisa per il rendimento del riduttore, non deve superare la coppia massima del riduttore:

$$T_b \times i_e / \eta_m \leq T_{2max}$$

## 7.0 Posizioni di montaggio

Per la completa definizione della forma costruttiva del riduttore occorre definire la posizione di montaggio. In base alla posizione è inoltre possibile determinare i tappi per riempimento, livello e scarico dell'olio.

Vedi pag. H46 - H48.

.

## 8.0 Istruzioni di installazione

Le informazioni contenute nel presente capitolo non sono esaustive, ma rappresentano una sintesi parziale del manuale di uso e manutenzione al quale occorre fare sempre riferimento.

### 8.1 Installazione

#### Riduttori con flangia e albero maschio:

il telaio di accoppiamento deve avere la superficie di appoggio al riduttore non verniciata, piana, lavorata di macchina utensile e perpendicolare all'asse di rotazione. La tabella seguente mostra la tolleranza dei centraggi sugli accoppiamenti. Per la serie RE i centraggi hanno tolleranza H8.

Diametri	[mm]	80 - 120	120 - 180	180 - 250
Tolleranze	[mm]	+0.054 0	+0.063 0	+0.072 0
Diametri	[mm]	250 - 315	315 - 400	400 - 500
Tolleranze	[mm]	+0.081 0	+0.089 0	+0.097 0

I riduttori delle grandezze da RE1520 a RE8000 con uscita H sono provvisti di due diametri di centraggio. È sufficiente realizzare sulla struttura un solo centraggio, quello maggiore, quando sull'albero in uscita i carichi radiali non sono presenti o sono inferiori al 50% dei carichi massimi ammessi.

Per la gamma GB i centraggi hanno tolleranza F8.

Diametri	[mm]	80 - 120	120 - 180	180 - 250
Tolleranze	[mm]	+0.186 +0.076	+0.205 +0.080	+0.226 +0.086

#### Riduttori con albero femmina scanalato:

i riduttori con supporto di uscita femmina non sono idonei a sopportare carichi radiali sull'uscita; è pertanto molto importante curare l'allineamento tra riduttore e albero condotto. Occorre inoltre verificare che l'albero condotto non subisca flessioni durante le fasi di lavoro.

#### Riduttori con fissaggio a piede:

il riduttore deve essere fissato su una superficie di appoggio piana ed essere in asse con la macchina condotta; è importante che ogni operazione di livellamento e allineamento venga eseguita con accuratezza. Un errato appoggio o un allineamento non corretto pregiudicano la vita del riduttore.

#### Riduttori con montaggio pendolare:

occorre realizzare un ancoraggio del braccio di reazione non vincolato nella direzione dell'asse del riduttore. L'ancoraggio deve inoltre essere opportunamente ammortizzato.

Nelle tavole dimensionali di ogni riduttore sono riportati i valori minimi di lunghezza del braccio di reazione per realizzare l'applicazione in modo corretto.

**Coppie di serraggio e corrispondenti forze assiali esercitate dalle viti a passo grosso (tab. 4)**

	Classe 8.8		Classe 10.9		Classe 12.9

## 8.2 Lubrificazione

### I riduttori sono forniti senza olio.

Prima della messa in funzione occorre riempire il riduttore fino al livello previsto con uno degli oli lubrificanti consigliati. La scelta e la quantità dell'olio saranno demandate all'installatore / utilizzatore in base al tipo di applicazione.

## 8.3 Vernice

I riduttori sono forniti non verniciati. Alcune parti sono trattate con uno strato di fondo idrosolubile estere epossidico rosso ossido. È cura del cliente realizzare la finitura utilizzando una vernice compatibile con quella di fondo. Gli anelli di tenuta devono essere protetti durante la verniciatura.

## 8.4 Montaggio dei motori a flangia

Il montaggio dei motori alle flange di accoppiamento fornite da Dinamic Oil è un'operazione particolarmente semplice, ma da eseguire seguendo alcuni importanti suggerimenti:

- lubrificare l'accoppiamento con un leggero velo di grasso o lubrificante anti-grippaggio;
- assicurarsi che il motore vada liberamente a battuta sulla flangia di fissaggio del riduttore senza forzare né sull'albero né sul centraggio;
- serrare le viti.

Per ulteriori informazioni si faccia riferimento al manuale d'uso e manutenzione.

## 8.5 Montaggio dei motori con giunto di collegamento

Quando vengono utilizzati giunti di collegamento fra motore e riduttore, bisogna verificare che l'allineamento deve essere compatibile col tipo di giunto utilizzato. I giunti sono largamente usati in applicazioni industriali per le varie funzioni che essi possono svolgere come:

- limitare la coppia in ingresso,
- smorzare vibrazioni provenienti dal motore,
- compensare piccoli disallineamenti.

Nell'applicazione dei giunti si faccia riferimento ai manuali d'uso dei fornitori di detto componente.

## 8.6 Peso dei riduttori

I pesi dei vari riduttori sono riportati, a titolo indicativo, a pag. H52.

## 9.0 Stoccaggio

Le informazioni contenute nel presente capitolo non sono esaustive, ma rappresentano una sintesi parziale del manuale di uso e manutenzione al quale occorre fare sempre riferimento.

I riduttori non devono essere conservati all'aperto o a diretto contatto con il suolo. Per lunghi periodi di stoccaggio devono essere riempiti d'olio, con le parti esterne lavorate ricoperte di grasso; le superfici di accoppiamento vanno protette con agenti antiossidanti, i tappi di sfiato sostituiti con tappi chiusi e si raccomanda l'azionamento a vuoto (è sufficiente una rotazione completa dell'albero di uscita) almeno ogni due mesi.

Per maggiori informazioni sullo stoccaggio si faccia riferimento al manuale d'uso e manutenzione.

## 10.0 Lubrificazione

### 10.1 Tipo di lubrificazione

La lubrificazione dei riduttori avviene per bagno d'olio; prima della messa in funzione del riduttore occorre procedere al riempimento d'olio, accertandosi visivamente attraverso il tappo di livello che sia raggiunto il livello corretto; tale operazione richiede particolare attenzione e si deve verificare nuovamente, dopo pochi minuti di funzionamento, che il livello sia stato effettuato correttamente. Le quantità d'olio a catalogo sono indicative e variano in funzione del rapporto di riduzione e del tipo di ingresso e di uscita del riduttore.

### 10.2 Scelta dell'olio

Può essere impiegato qualunque olio per trasmissioni meccaniche con additivazione EP che soddisfi la classe di viscosità da ISO VG220 a ISO VG320 secondo ISO 3448. In casi particolari possono essere utilizzati oli con viscosità diverse; in tal caso contattare il servizio tecnico Dinamic Oil. La viscosità dell'olio deve essere selezionata in funzione della temperatura ambiente e della reale temperatura di lavoro del riduttore. Per riduttori che devono operare a temperature ambiente molto elevate o con forte escursione termica si raccomanda l'uso di oli a base sintetica. Nei riduttori con montaggio verticale e funzionamento continuo l'olio può subire un elevato surriscaldamento; in questi casi si rende necessario un serbatoio esterno (che può essere fornito da Dinamic Oil) per consentire all'olio di espandersi per effetto della sua dilatazione termica.

### 10.3 Cambio dell'olio

Il cambio dell'olio deve essere effettuato dopo le prime 150 ore di lavoro, successivamente secondo le tempistiche della tabella seguente, o almeno ogni 2 anni.

#### Durata media di funzionamento secondo il tipo di olio

Temperatura di funzionamento [°C]	Tipo di olio		
	Olio minerale [h]	Olio sintetico [h]	
		Polialfaolefine (PAO)	Poliglicoli (PG)
70°	7000	15000	16000
80°	5000	10000	12000
90°	3000	7500	9000

### 10.4 Quantità di olio

Le quantità di olio per la corretta lubrificazione dei riduttori sono riportate, a titolo indicativo, da pag. H49.

## 10.5 Lubrificanti consigliati

Viscosità consigliata (tab. 5)

ISO VG 3448	TEMPERATURA DI FUNZIONAMENTO [C°]												
	Temperatura ambiente [C°]

## 10.6 Temperatura

La temperatura ambiente consigliata, per l'utilizzo di riduttori standard, dovrà essere compresa fra -15°C e +40°C.

## 11.0 Unità autonome di raffreddamento

Quando la potenza trasmessa è superiore alla potenza termica dissipabile dal riduttore, è necessario l'impiego di un'unità di raffreddamento, in grado di smaltire la potenza termica in eccedenza.

Dinamic Oil propone una serie di unità autonome di raffreddamento, olio-acqua ed olio-aria, in grado di dissipare fino a 50kW. Per potenze superiori contattare l'ufficio tecnico.

### 11.1 Unità autonome di raffreddamento olio-acqua, composizione standard e personalizzata

Le unità di raffreddamento serie URO/W standard sono composte da:

- Uno scambiatore di calore acqua-olio.
- Una motopompa (collegamento motore-pompa con giunto e supporto; pompa con tenute al viton) composta da un motore a 4 poli in forma B5, alimentazione standard trifase 230/400V - 50Hz e da una pompa ad ingranaggi.
- Manometro 0-16 bar montato fra pompa e scambiatore di calore.
- Termometro analogico 0-120 °C, montato in uscita dallo scambiatore.
- Filtro, da installare in mandata al serbatoio, per la pulizia dell'olio scaricato (opzione consigliata).

Per un'esecuzione personalizzata è possibile equipaggiare l'unità con i seguenti optional:

- Pressostato di minima con contatti in scambio, da montare fra pompa e scambiatore di calore. (In questo caso è già presente la predisposizione sull'impianto idraulico).
- Flussostato elettrico per il totale controllo della portata dell'olio.

Unità	Capacità [kW]*	Motopompa olio		Portata acqua [l/min]*	A	B	C
		[kW]	[l/min]				
URO/W 4	4	0.37	16	8	500	350	400
URO/W 6	6	0.37	16	10	500	350	400
URO/W 9	9	0.55	16	16	500	350	400
URO/W 13	13	1.1	30	25	500	350	400
URO/W 21	21	1.5	30	40	500	400	450
URO/W 31	31	2.2	56	50	720	510	520
URO/W 50	50	3.0	80	80	730	520	520

\* I valori indicati in tabella sono riferiti ad una temperatura dell'acqua di 20° C.

## 11.2 Unità autonome di raffreddamento olio-aria, composizione standard e personalizzata

Le unità di raffreddamento serie URO/A standard sono composte da:

- Uno scambiatore di calore aria-olio completo di ventilatore e termostato regolabile 0-90 ° C già cablato.
- Una motopompa collegamento motore-pompa con giunto e supporto , pompa con tenuta al viton) composto da un motore a 4 poli in forma B3/B5, alimentazione standard 230/400V - 50Hz e da una pompa a vite.
- Manometro 0-16 bar montato fra pompa e scambiatore di calore.
- Termometro analogico 0-120 °C, montato in uscita dallo scambiatore.
- Filtro, da installare in mandata al serbatoio, per la pulizia dell'olio scaricato (opzione consigliata).

Per un'esecuzione personalizzata è possibile equipaggiare l'unità con i seguenti optional:

- Pressostato di minima con contatti in scambio, da montare fra pompa e scambiatore di calore. (In questo caso è già presente la predisposizione sull'impianto idraulico).
- Flussostato elettrico per il totale controllo della portata dell'olio.

Unità	Capacità [kW]*	Motopompa olio		Motoventilatore		A	B	C
		[kW]	[l/min]	[kW]	[m³/h]			
URO/A 5	5	1.5	30	0.12	900	660	430	700
URO/A 7	7	1.5	30	0.12	1300	710	510	700
URO/A 10	10	1.5	30	0.18	2750	710	510	830
URO/A 13	13	1.5	30	0.23	2750	710	510	830
URO/A 16	16	2.2	56	0.23	3500	710	510	1010
URO/A 21	21	2.2	56	0.56	6300	800	500	1200
URO/A 26	26	3	56	0.56	7450	800	500	1265
URO/A 30	30	3	80	0.56	7450	800	500	1265
URO/A 40	40	2.2	56	0.9	9500	1010	600	1350
URO/A 46	46	3	80	0.9	9500	1010	600	1350

\* I valori indicati in tabella sono riferiti ad una temperatura dell'aria di 20° C.

To meet the needs of an increasingly demanding and selective market Dinamic Oil have completely updated their RE and GB ranges of planetary gearboxes. With the introduction of new sizes the already comprehensive product lines have been extended and enhanced in line with feedback from the power transmission market.

Planetary gearboxes are suited to a broad range of applications covering the high overload characteristics found in the mobile industry to the longevity and reliability requirements of the industrial sector.

In the mobile market Dinamic Oil products can be found in machinery for lifting & transportation, building and construction, agriculture & marine; specific applications include concrete pumps, excavators, cranes and aerial platforms, in fact anywhere rotational movement is required. The use of planetary gearboxes for industrial applications is growing rapidly and they are now common in sheet metal, steel, plastics water treatment, chemical, energy mining and process industries.

The new 2012 catalogue facilitates quick & easy preliminary gearbox selection based on the transmissible power adjusted by the appropriate service factors. However, the Dinamic Oil Technical Sales Department is at your disposal providing a wealth of experience backed by the latest technology to provide confirmation and ensure the most cost effective solution in accordance with relevant standards.

The catalogue illustrates the range of gearboxes in production at the time of going to press with maximum torque capacity between 1000Nm and 3,000,000Nm. If your requirements fall outside this range please contact us.

The renowned versatility of Dinamic Oil gearboxes has been further expanded with the introduction of new input and output adaptors and accessories to make this the most comprehensive transmission system on the market

## 2.0 Construction Options

### USABLE MOTORS

- 1 Electric motor
- 2 Orbital hydraulic motor
- 3 Hydraulic motor with axial pistons
- 4 Hydraulic motor with radial pistons
- 5 Orbital hydraulic motor "MLR"

### TYPES OF INPUT

- 9 Preparation for motor connection
- 10 Input shaft
- 11 Direct electric motor adapter
- 12 Direct orbital motor adapter
- 13 Negative brake "F1../F2.."
- 14 Negative brake "F5../F6../F8../F9"
- 15 Standard flange
- 16 Adaptor "MZ"
- 17 Adaptor "MD"

### REDUCTION STAGES

- 18 Angular gearbox with direct input
- 19 One reduction stage
- 20 Two reduction stages
- 21 Three reduction stages
- 22 Four reduction stages
- 23 Five reduction stages

### SUPPORTS AND OUTPUT SHAFTS

- 24 Output support "N"
- 25 Output support "P"
- 26 Output support "T"
- 27 Output support "TR"
- 28 Output support "TL"
- 29 Output support "H"
- 30 Output support "F"
- 31 Output support "NQ"
- 32 Cylindrical output shaft
- 33 Splined output support
- 34 Female splined output shaft
- 35 Hexagonal output shaft
- 36 Female cylindrical output shaft

### ACCESSORIES

- 37 Pinion "P"
- 38 Flange "FL"
- 39 Splined bushing "BS"
- 40 Hexagonal bushing "ES"
- 41 Splined bar "BF"
- 42 Shrink disk "GA"
- 43 End plate "EP"
- 44 Oil expansion tank "VE"

### 3.0 Technical Definitions

All values specified in this catalogue were calculated using the ISO 6336 and ISO 281 standards, but may not meet additional requirements set by the internal regulations of certifying bodies.

To select products that comply with these regulations, contact Dinamic Oil's sales team.

#### $f_s$ - Service Factor

this factor represents the application's industrial rating; it depends on operating conditions, type of drive and frequency of start-up.

The information provided in this catalog is calculated for  $f_s = 1$ . The service factor value of a gearbox may be calculated by dividing its nominal power by its absorbed power.

Service factors (tab. 1)

	OPERATING CONDITIONS									
	Uniform U			With moderate shocks M			With heavy shocks H			
hours / day	START-UPS / HOUR									
	< 16	16 - 63	64 - 250	< 16	16 - 63	64 - 250	< 16	16 - 63	64 - 250	
	< 0.5	0.9	1.3	1.5	0.9	1.3	1.5	1.2	1.5	1.8
	0.5 - 3	0.9	1.3	1.5	1.2	1.5	1.8	1.7	2.0	2.3
	3 - 8	1.2	1.5	1.8	1.4	1.8	2.0	1.9	2.3	2.8
8 - 24	1.4	1.8	2.0	1.7	2.0	2.5	2.4	2.8	3.0	

#### $P_1$ - Nominal Power [kW]

the mechanical power transmitted by the gearbox, related to input. At  $f_s = 1$  the gearbox has a theoretical lifetime of 10000 hours under the ISO 6336 standard. This value does not take into account any limits on the gearbox's thermal capacity, as it is exclusively based on mechanical resistance in accordance with the speed of use.

#### $P_a$ - Absorbed Power [kW]

relates to installed or available power, the amount of power actually absorbed by the application, at the gearbox input

#### $P_t$ - Thermal Power [kW]

the maximum mechanical power the gearbox can transmit while in continuous operation, with splash lubrication, without going beyond its maximum temperature level (oil temperature below 90°C). More power may be transmitted using a Viton seal and synthetic oils or special cooling devices. The values indicated for various gearbox sizes refer to continuous operation with input speeds of 1500 RPM, at an ambient temperature of 20°C and an altitude of 0 / 500 m, for indoor applications. Under different conditions of use, thermal power must be multiplied by the thermal factors identified in the tables below. For limited periods of operation, followed by periods of rest long enough to guarantee sufficient cooling of the gearbox, thermal power loses its significance and may be neglected.

## Thermal Factors (tab. 2)

Ambient Temperature	Operating Time [%]				
	100%	80%	60%	40%	20%
10°	1.2	1.3	1.4	1.6	1.8
20°	1.0	1.1	1.3	1.4	1.6
30°	0.8	1.0	1.1	1.3	1.4
40°	0.7	0.8	1.0	1.1	1.3
50°	0.5	0.7	0.8	1.0	1.1

Altitude [m]	Input Speed [RPM]				
	400	800	1000	1500	2000
0	1.2	1.1	1.1	1.0	0.7
500	1.2	1.1	1.1	1.0	0.7
1000	1.1	1.0	1.0	0.9	0.6
1500	1.1	1.0	1.0	0.9	0.6
2000	1.1	1.0	1.0	0.9	0.6

## $P_d$ - Power to be Dissipated [kW]

the power that a cooling system must dissipate if the power to be transmitted exceeds the gearbox's thermal power.

## $\eta_m$ - Mechanical Efficiency

The ratio between mechanical power output and input; normally considered equal to  $0.97 \div 0.98$  for each epicycloidal reduction stage in the gearbox, and equal to  $0.94 \div 0.95$  for bevel gear; the actual value depends on a number of factors including speed, torque, ratio, assembly position and lubrication.

## $T_2$ - Torque Transmitted [Nm]

this value represents torque continuously applied at a speed of  $n_1$ , at which the gearbox has a theoretical lifetime of 10000 h for gears, or 5000 h ( $L_{h10}$ ) for the bearings in gear mechanisms.

## $T_{max}$ - Maximum Transmissible torque [Nm]

the maximum torque transmitted by the accessory supplied with the gearbox, if applicable. This value may limit the maximum transmissible torque of the gearbox.

## $T_{2max}$ - Maximum Torque [Nm]

the maximum admissible output torque, as a peak value or for brief periods of time (calculated at 90% Rs of the weakest component).

For drives with a high number of start-ups or inversions, appropriately reduced maximum torque values should be considered.

The value specified refers to the version with a splined female shaft (FS); different versions may have lower values.

## $T_b$ - Braking Torque [Nm]

the value of braking torque that may be conveyed statically by the negative brake.

### **$n_1$ - Input Speed [RPM]**

the speed on the fast side of the gearbox.

### **$n_2$ - Output Speed [RPM]**

the speed on the slow side of the gearbox.

### **$n_{1max}$ - Maximum Speed [RPM]**

the maximum input speed at the brake. For applications with higher values, contact Dinamic Oil's sales service to determine application compatibility.

### **$i_e$ - Effective Reduction Ratio**

the actual reduction ratio, meaning the ratio between the gearbox's input and output speeds.

### **$n_{xh}$ - Duration Index [RPMxh]**

the value of the product between speed and duration of theoretical lifetime in hours. This value is expressed as  $n_2xh$  when used with output speed,  $n_1xh$  with used with input speed.

#### **Duration Values Required for Different Applications (tab. 3)**

Application	Required Lifetime
Agricultural machinery	300 - 3000
Machines operated intermittently or for short periods of time (construction machines)	3000 - 8000
Machines operated intermittently or for short periods of time with high operational reliability (freight lifts)	8000 - 12000
Machines operated 8 hours a day but not all the time (various industrial machines, rotary mills)	10000 - 25000
Machines operated 8 hours a day all the time (various industrial machines, conveyor belts)	20000 - 30000
Machines operated continuously (rolling mills, textiles machines)	40000 - 50000

### **$k_f$ - Correction Factor**

the factor applied to calculate the theoretical lifetime of bearings with male shafts for values of  $n_{xh}$  other than those shown in catalog diagrams. External load curves are calculated for all gearboxes as:

- $n_2xh = 100000$  for output supports
- $n_1xh = 1500000$  for input supports

### **$L_{min}$ - Minimum Length of Torque Arm [mm]**

the minimum length recommended for the torque arm, applied to pendular applications.

## 4.0 Gearbox selection

### 4.1 Selection

Gearbox selection is based on the service factor required by the application and the required output speed. Once the electric motor has been determined (in terms of nominal speed and power), select the gearbox with the reduction ratio required to reach the required output speed and nominal power needed to ensure that the ratio between its value and the value of the motor's rated power is higher than the service factor.

$$i_e = n_1 / n_2$$

$$P_1 \geq P_a \times f_s$$

Confirm the selection with other parameters such as thermal power, impulse torque and any radial or axial loads acting on the male input and output shafts.

If the drive is not electric, apply the same method for the output torque required by the application rather than the nominal power.

### 4.2 Verification

#### **Gearbox input and output supports:**

these must be verified based on any radial and axial loads present. For each model, the catalog provides diagrams representing the dynamic radial loads that may be supported in accordance with the ISO 281 standard with a duration of  $L_{10}$  corresponding to  $n_x h = 100000$ . For different durations, an applicable radial load can be calculated by multiplying the values in the diagrams by the corrective factor  $k_f$ .

The radial load cannot in any case exceed the maximum value on the curve in the diagram.

Make sure that if there are axial loads, they do not exceed the maximum permitted value.

#### **Output torque:**

this must never exceed the maximum transmissible torque of the selected gearbox. Carefully check that this value is higher than the maximum torque deliverable by the motor installed, shown at the gearbox output (that is, multiplied by the actual reduction ratio and the gearbox's mechanical yield).

#### **Input speed:**

for speeds other than those shown in the table, please contact the sales office.

#### **Thermal power:**

if installed power exceeds the gearbox's thermal power, select a larger gearbox and use synthetic oil with Viton seals or use a cooling circuit.

If you use Viton seals and synthetic oil, you may consider the thermal factor equivalent to an ambient temperature lower than 20°C with respect to the actual temperature, in order to consider the fact that the gearbox can withstand overheating 20°C over the projected data.

If you use a cooling system, the power to be dissipated is

$$P_d = (P_a - P_t) \cdot (1 - \eta_m)$$

The example shows the ordering code for a right angle planetary gearbox frame 210, with 3 reduction stages a foot mounted output support and a male splined shaft, and 78.7 reduction ratio, with a "ST" input and "SAE B", 16/32 15 teeth motor adapter flange. Horizontal mounting position and standard right angle positioning, and a splined bushing output accessory.

## 6.0 Negative Hydraulic Brakes

### 6.1 1.1 Negative Hydraulic Multi disk Brakes

Dinamic Oil gearboxes may have a static negative multi disk brakes and hydraulic control.

The brakes on models **F1** through **F2** are designed for direct assembly of orbital hydraulic motors with flanging, compliant with the SAE A Standard.

The brakes on models **F5** through **F6** reach greater braking torques and have an ST universal for connection to wide range of motors available on the market.

The brakes on model **F8** reach braking torques of up to 3000 Nm and have anl MU input for connection to a wide range of motors available on the market.

The brakes on model **F9** reach braking torques of up to 1500 Nm. An optional sprag clutch mechanism with a torque of up to 1200 Nm can also be mounted. They have a "SAE C" or "SAE D" input and or optional universal ST input. These can be used for connection to a wide range of motors available on the market.

The **MD** brake is assembled with a direct flange connection for MLR motors on reduction stages RE 110-240.

Braking is generated by springs which compress fixed tempered steel disks alternating with bronze disks; friction transforms this thrust into a braking torque.

The brakes open when hydraulic oil pressurizes the brake release port; the pressure acts on a piston which compresses the spring so that the disks can turn freely. These are parking brakes which act by creating static braking torque when hydraulic release pressure is zero. The action stops when hydraulic pressure reaches the minimum release value.

For the following brakes F1, F2 and standard versions of F5, F6 and F8, circa 0.1 liter of mineral oil, with an ISO VG 32 viscosity is required.

Several brake models - F5, F6, F8 and F9 - are available in special versions with a higher maximum velocity.

### 6.2 Brake Selection

The following criteria must be considered:

- Braking torques are calculated under zero release pressure; if there is counter-pressure in the hydraulic circuit the actual braking values will be reduced as follows:

Actual torque = Theoretical torque x (Opening pressure – Counter-pressure) / Pressure at the start of opening.

- Brake torque multiplied by the reduction ratio and divided by gearbox efficiency must be greater than or equal to the required output torque:

$$T_b \times i_e / \eta_m \geq T_2$$

- Except in particular cases, brake torque multiplied by the reduction ratio and divided by gearbox efficiency must not exceed the maximum gearbox torque:

$$T_b \times i_e / \eta_m \leq T_{2max}$$

## 7.0 Assembly Positions

For a complete definition of gearbox order code, it is necessary to determine the assembly position. This position defines the location of the oil filling caps, levels and drainage plugs.

See page H46 - H48.

## 8.0 Installation Instructions

The information in this chapter is indicative: it provides a partial summary of the installation and maintenance manual, which users should always refer to for more detailed information.

### 8.1 Installation

#### Gearboxes with flange and male shaft:

the coupling frame must have an unpainted, flat surface for the gearbox to rest on. The surface should be processed with machine tools and perpendicular to the axis of rotation. The table below shows the tolerance for centering on couplings. For the RE series, the centering has a tolerance of H8.

Diameter	[mm]	80 - 120	120 - 180	180 - 250
Tolerance	[mm]	+0.054 0	+0.063 0	+0.072 0
Diameter	[mm]	250 - 315	315 - 400	400 - 500
Tolerance	[mm]	+0.081 0	+0.089 0	+0.097 0

The gearboxes sized from RE1520 to RE8000 with output H have two pilot diameters. It is sufficient to use 1 pilot when the radial loads on the output shaft are not present or are less than 50% of the maximum permitted loads. For the GB line, the pilot diameter has a tolerance of F8.

Diameter	[mm]	80 - 120	120 - 180	180 - 250
Tolerance	[mm]	+0.186 +0.076	+0.205 +0.080	+0.226 +0.086

#### Gearboxes with a female splined shaft:

gearboxes with a female splined output shaft are not suitable for supporting radial loads on the output; it is therefore very important to carefully align the gearbox and the drive shaft. It is also necessary to check that the drive shaft does not bend while operating.

#### Gearboxes with Foot Support:

the gearbox foot support must be anchored to a flat surface and be aligned with the drive machine; it is important to align and level it very carefully. Incorrect support or alignment will affect the gearbox's lifetime.

#### Gearboxes with Pendular Assembly:

anchor the torque arm so that it is not constrained in the direction of the gearbox axis. The anchor point must have appropriate shock absorption.

The dimensional tables for each gearbox show the minimum length of the torque arm.

**Torques and corresponding axial forces exerted by large pitch screws (tab. 4)**

## 8.2 Lubrication

### **Gearboxes are supplied without oil.**

Before use, the gearbox should be filled up to the specified level with a recommended lubricant oil.

The choice and quantity of oil will be determined by the installer / user based on the type of application.

## 8.3 Paint

Gearboxes are supplied unpainted. Some parts are treated with a water-soluble base coat of red epoxy paint. The customer should paint them using a paint compatible with the base coat. Oil seals must be protected during painting

## 8.4 Assembling Flanged Motors

Assembling motors on the coupling flanges supplied by Dinamic Oil is easy, but these important recommendations should be followed:

- lubricate the coupling with a light layer of anti-seizure grease or lubricant;
- make sure the motor runs freely but snugly on the flange, anchoring the gearbox in place, without forcing the shaft or the pilot;
- tighten screws.

Refer to the installation and maintenance manual for additional information.

## 8.5 Assembling Motors with Connection Couplings

When connection couplings are used between the motor and the gearbox, ensure that the alignment is compatible with the type of coupling used. Couplings are widely used in industrial applications for a variety of functions, such as:

- limiting input torque,
- absorbing vibrations from the motor,
- compensating for small misalignments.

When using connection couplings, refer to the instruction manuals supplied by the suppliers of the component.

## 8.6 Gearbox Weight

For your information, the indicative weights of various gearboxes are provided on page H52.

## 9.0 Storage

*The information in this chapter is indicative: it provides a partial summary of the installation and maintenance manual, which users should always refer to for more detailed information.*

Gearboxes must not be stored outdoors or in direct contact with the ground or sun. For long-term storage they must be filled with oil, and all external parts covered with grease; coupling surfaces must be protected with rust proof agents, breather plugs replaced by closed plugs and the gearbox should be operated under no load at least once every two months (one complete turn of the output shaft is sufficient).

Refer to the installation and maintenance manual for additional information on storage.

## 10.0 Lubrication

### 10.1 Type of Lubrication

Gearboxes are lubricated in oil baths; before operating the gearbox, fill it with oil and look through the level cap to see if the oil is at the correct level; this operation requires special attention, and you must check the level again after a few minutes of operation. The oil quantities identified in the catalog are approximate and vary according to the reduction ratio and the type of gearbox input and output.

### 10.2 Selecting an Oil

You may use any mechanical transmission oil with EP additives in viscosity classes ISO VG220 to ISO VG320 under ISO 3448. In special cases, oils with different viscosities may be used; for more information on these exceptions, contact Dinamic Oil's Technical Assistance Service. Oil viscosity must be selected based on ambient temperature and the actual operating temperature of the gearbox. If the gearboxes are being operated at very high ambient temperatures, synthetic oil is recommended. Oil may suddenly overheat in gearboxes assembled vertically and continuously functioning; in these cases it is necessary to use an external expansion tank (which Dinamic Oil may supply) to allow the oil to expand through thermal dilation.

### 10.3 Changing the oil

Oil must be changed after the first 150 hours of operation, and then according to the following table, or least every 2 years.

**Average operating duration to oil type**

Operating temperature [°C]	Oil type		
	Mineraloil [h]	Syntheticoil [h]	
		Polyalphaolefins (PAO)	Polyglycols (PG)
70°	7000	15000	16000
80°	5000	10000	12000
90°	3000	7500	9000

### 10.4 Oil quantity

Information on the quantity of oil required for proper gearbox lubrication is provided on page H49.

## 10.6 Temperature

The recommended ambient temperature for use of standard gearboxes is from -15°C to +40°C.

## 11.0 Independent Cooling Units

When transmitted power exceeds the thermal power that may be dissipated by the reducer, it is necessary to use a cooling unit to dispose of excessive thermal power.

Dinamic Oil offers a series of independent oil/water and oil/air cooling units which can dissipate up to 50 kW. For greater power levels, contact our technical office.

### 11.1 Independent oil/water cooling units, standard and customized composition.

Standard series URO/W cooling units are composed of:

- A water/oil heat exchanger.
- A motor-driven pump (motor/pump connection with joint and support; pump with viton seals) composed of a 4 pole B5 motor, standard three-phase 230/400V 50Hz power supply and gear pump.
- 0-16 bar manometer assembled between pump and heat exchanger.
- Analogue 0-120 °C thermometer mounted at the exchanger exit.
- Filter for installation on the tank delivery for cleaning the oil released (recommended option).

Units in customized installations may be equipped with the following options:

- Minimum pressure switch with exchange contacts, for assembly between the pump and the heat exchanger. (In this case the hydraulic system is already prepared).
- Electric flow switch for total control of oil flow. .

Unit	Capacity [kW]*	Motor-driven oil pump		Water quantity [l/min]*	A	B	C
		[kW]	[l/min]				
URO/W 4	4	0.37	16	8	500	350	400

URO/W 50	50	3.0	80	80	730	520	520

\* The values appearing in the table are for a water temperature of 20° C..

## 11.2 Independent oil/air cooling units, standard and customized composition

Standard series URO/A cooling units are composed of:

- An air/oil heat exchanger complete with a fan and an adjustable 0-90 ° C thermostat, already wired.
- A motor-driven pump (motor/pump connection with joint and support; pump with viton seals) composed of a 4 pole B3/ B5 motor, standard 230/400V - 50Hz power supply and screw pump.
- 0-16 bar manometer assembled between pump and heat exchanger.
- Analogue 0-120 °C thermometer mounted at the exchanger exit.
- Filter for installation on the tank delivery for cleaning the oil released (recommended option).

Units in customized installations may be equipped with the following options:

- Minimum pressure switch with exchange contacts, for assembly between the pump and the heat exchanger. (In this case the hydraulic system is already prepared).
- Electric flow switch for total control of oil flow.
- Filter for installation on the tank delivery for cleaning the oil released (recommended option).

**110 - 210**

**I****ENTRATE, ACCESSORI, POSIZIONI DI MONTAGGIO, PESI E VOLUMI**

Le tavole degli accessori comprendono flange di adattamento e freni. In questa sezione sono inoltre rappresentate le varie posizioni di lavoro dei riduttori e le relative posizioni dei tappi di carico, scarico e livello olio e quelli di sfiato aria.

**I pesi dei riduttori ed i volumi di olio sono puramente indicativi in quanto variano al variare del rapporto e degli accessori installati.**

Qualora si desideri un'informazione precisa si contatti la rete vendita Dinamic Oil comunicando il codice di ordinazione in modo completo.

**UK****INPUTS, ACCESSORIES, WEIGHTS, VOLUMES AND MOUNTING POSITIONS**

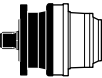

The accessory tables include motor, adapter flanges and brakes. This section also shows the gearboxes working positions options; the location for oil filling, oil level and oil drain ports, as well as breather plugs.

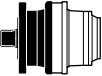

**Weights and oil volumes are purely indicatives because they vary with respect to the installed accessories and the reduction ratio.**

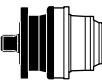

When a precise figure is needed please contact Dinamic Oil sales network specifying the complete ordering code.
